

K&B Machine Works, LLC's newly improved stabbing guide provides strength and durability combined with a more user-friendly design. Whether running casing or tubing, K&B's stabbing guide will virtually eliminate mis-stabbing and cross-threading. This versatile tool helps maintain control of pipe from 1 inch to 20 inches in diameter through rough seas and adverse weather conditions. The combination of an outer aluminum frame, adjustable latch and a heavy duty stainless steel hinge ensures very little maintenance is needed. Repair is simple, with each component replaceable in minutes. This feature prevents costly down time. K&B has 37 years of successful service in the industry, and its improved stabbing guide design offers significant safety and assembly advantages.

Majors Benefits of K&B's Stabbing Guide:

- Four interchangeable parts provide versatility when assembling, while insuring stability with lightweight but durable aluminum.
- Stocking of parts offers a cost-effective way to maintain a complete line of stabbing guides by alternating inserts with standard frames.
- Interchangeable parts create an ideal opportunity for instituting a stocking program to provide for multiple field locations.

"The K&B stabbing guide has performed without any problems for years. I would highly recommend it to anyone."
